ACME COOLS THE WORLD'S BEVERAGES

In the desert and on the high seas, Acme ices the drinks.

Erie, Pa. (April 28, 2006) - For more than 50 years, the finest domestic and international hotels, restaurants and cruise ships have depended on Acme ice systems for perfect, sparkling ice that melts slower, cools faster and doesn't dilute the taste of beverages.

Acme offers a full range of ice machines, bins, crushers and dispensers, capable of producing from 100 to 1,200 pounds of pure ice per day. Each Acme ice system can be customized to produce full cubes, half cubes or cublets. And, with the system's unique stacking ability, you can add capacity as your requirements grow or you can have a variety of cube sizes in one location.

Jim Smith, Acme sales manager states: "Our reputation for dependability and service is unmatched in the industry. Our systems are engineered to produce pure ice, free from impurities and foreign substances. Our ice cubes have been proven to melt slower and taste better than any other commercial ice."

Designed for ease of service through "up front" engineering, all major controls and components are accessible from the front of the unit. Plus, with commonality of parts, another Acme innovation, service responsiveness is maximized. According to Smith, all of the Acme systems are built to last with type 304 stainless steel and are corrosion resistant, inside and out. In addition, all compressors are manufactured with zero-ozone depleting HFCR 404a refrigerant.

The Acme line of premier ice systems are the longest lasting, most reliable ice systems available in the world today.

Acme – the Cold Standard in Ice!
